

## Complete Summary

---

### TITLE

Chronic kidney disease (CKD): the percentage of patients on the CKD register in whom the last blood pressure reading, measured in the previous 15 months, is 140/85 or less.

### SOURCE(S)

British Medical Association (BMA) and NHS Employers. Quality and outcomes framework guidance for GMS contract 2009/10. London (UK): British Medical Association, National Health Service Confederation; 2009 Mar. 162 p.

## Measure Domain

### PRIMARY MEASURE DOMAIN

Outcome

The validity of measures depends on how they are built. By examining the key building blocks of a measure, you can assess its validity for your purpose. For more information, visit the [Measure Validity](#) page.

### SECONDARY MEASURE DOMAIN

Does not apply to this measure

## Brief Abstract

### DESCRIPTION

This measure is used to assess the percentage of patients on the chronic kidney disease (CKD) register in whom the last blood pressure reading, measured in the previous 15 months, is 140/85 or less.

### RATIONALE

The international classification developed by the US National Kidney Foundation describes five stages of chronic kidney disease (CKD) using an estimated glomerular filtration rate (eGFR) to measure kidney function. People with CKD stages three to five have, by definition, less than 60 percent of their kidney function. Stage three is a moderate decrease in GFR with or without other evidence of kidney damage. Several groups (National Institute for Health and Clinical Excellence [NICE], Scottish Intercollegiate Guidelines Network [SIGN],

United Kingdom Consensus) have recommended splitting stage 3 into 3A and 3B (see Table 1 in the original measure documentation). Stage four is a severe decrease in GFR with or without other evidence of kidney damage and stage five is established renal failure. The Quality of Outcomes Framework (QOF) indicator set refers to people with stage 3 to 5 CKD.

CKD is a long-term condition; the most recent population data from the National Health and Nutrition Examination Survey (NHANES 1999-2004) suggests that the age standardised prevalence of stage 3 to 5 CKD in the non-institutionalised American population is approximately 6% (Coresh et al., JAMA 2007). The prevalence in females was higher than in males (6.9 versus 4.9%). In the fully adjusted model, the prevalence of low GFR was strongly associated with diagnosed diabetes (OR, 1.54; 95% CI, 1.28-1.80) and hypertension (OR, 1.98; 95%CI, 1.73-2.67) as well as higher body mass index (BMI) (OR, 1.08; 95% CI, 1.02-1.15 per 5-unit increment of BMI).

In the UK the prevalence of CKD stage 3–5 was 8.5% and was higher in females, 10.6% in females versus 5.8% in males (Stevens et al., Kidney International 2007). The Association of Public Health Observatories has modelled the prevalence of CKD for England and Wales based on the results of the study by Stevens et al. and report a population prevalence of 8.9%.

The NHS Information Centre reports a prevalence of CKD for 2006/7 of 2.4% using QMAS returns suggesting that, to date, CKD is under-reported in English general practitioner (GP) practices.

This measure is one of five [Chronic Kidney Disease](#) measures. The CKD indicator set applies to people with stage three, four and five CKD (eGFR less than 60 mL/min/1.73m<sup>2</sup> confirmed with at least two separate readings over a 3 month period).

CKD may be progressive; prevalence increase with age and female sex but progression increases with male sex, and South Asian and African Caribbean ethnicity. People of South Asian origin are particularly at risk of having both diabetes and CKD. Diabetes is more common in this community than in the population overall. People of African and African Caribbean origin have an increased risk of CKD linked to hypertension.

Only a minority of people with stage one or two CKD go on to develop more advanced disease and symptoms do not usually appear until stage four. Where eGFR has persistently been recorded below 60 (less than 60) the CKD (stage 3) label should continue to apply, even if future management may lead to an improvement in eGFR.

Early identification of CKD is important as it allows appropriate measures to be taken not only to slow or prevent the progression to more serious CKD but also to combat the major risk of illness or death due to cardiovascular disease. The presence of proteinuria is a key risk multiplier at all stages of CKD and CKD is an independent risk factor for cardiovascular disease and a multiplier of other risk factors (Wali and Henrich, Cardiol Clin 2005).

NICE guidance, early identification and management of Chronic Kidney Disease in adults in primary and secondary care was published in September 2008. See also the SIGN Guideline 103, Diagnosis and management of CKD in adults, June 2008.

These indicators reflect both of the guidance documents:

- Albumin-creatinine ratio (ACR) is the preferred measure of proteinuria
- NICE suggests blood pressure (BP) should be kept below 140 (systolic) and 90 (diastolic) with a target for systolic of between 120 and 139 mm Hg. There is a tougher standard for diabetes. This compares with a BP audit standard of 145/85 in this guidance for 40 to 70% of the CKD population
- NICE recommends that the use of ACE inhibitors when there is hypertension and an ACR of greater than or equal to 30mg/mmol. However, when ACR greater than or equal to 70mg/mmol NICE recommends ACE inhibitors even in the absence of hypertension. As with BP there are stricter standards in diabetes
- NICE divides stage 3 into Stage 3a and 3b. They recommend testing for bone disease and anaemia in Stage 3b (eGFR 30 to 44), as well as stages 4 and 5
- NICE also recommends addition of the suffix (p) to denote significant proteinuria, defined as an ACR greater than or equal to 30 mg/mmol (protein-creatinine ratio [PCR] greater than or equal to 50 mg/mmol).

The QOF indicators are likely to converge with NICE guidance over coming years.

Studies have shown that in people over 65 years and in people with diabetes, normal blood pressure is hard to achieve but is important (Anderson et al., American Journal of Kidney Disease 2005).

See also the latest British Hypertension Society guidelines 2004 (Williams et al., J Hum HT 2004). This suggests an "optimal" blood pressure target in CKD of 130/80 or 127/75 if greater than 1 g proteinuria. These targets in turn are derived from the Modification of Diet in Renal Disease study (Klahr et al., NEJM 1994; Peterson et al., Ann Int Med 1995).

In practice, these targets are often hard to achieve and the indicator's 40% to 70% audit standard reflects this. The lower the blood pressure achieved the better for patient care; 140/85 is taken as a pragmatic starting point for a new quality indicator.

## **PRIMARY CLINICAL COMPONENT**

Chronic kidney disease (CKD); blood pressure

## **DENOMINATOR DESCRIPTION**

Patients who are on the chronic kidney disease (CKD) register\* of a practice

**\*Note:** The register includes patients aged 18 years and over with CKD (US National Kidney Foundation: Stage 3 to 5 CKD).

## **NUMERATOR DESCRIPTION**

Number of patients from the denominator in whom the last blood pressure reading, measured in the previous 15 months, is 140/85 or less

### Evidence Supporting the Measure

#### EVIDENCE SUPPORTING THE CRITERION OF QUALITY

- A clinical practice guideline or other peer-reviewed synthesis of the clinical evidence
- A formal consensus procedure involving experts in relevant clinical, methodological, and organizational sciences
- One or more research studies published in a National Library of Medicine (NLM) indexed, peer-reviewed journal

#### NATIONAL GUIDELINE CLEARINGHOUSE LINK

- [Diagnosis and management of chronic kidney disease.](#)

### Evidence Supporting Need for the Measure

#### NEED FOR THE MEASURE

Unspecified

### State of Use of the Measure

#### STATE OF USE

Current routine use

#### CURRENT USE

Internal quality improvement  
National reporting  
Pay-for-performance

### Application of Measure in its Current Use

#### CARE SETTING

Physician Group Practices/Clinics

#### PROFESSIONALS RESPONSIBLE FOR HEALTH CARE

Physicians

#### LOWEST LEVEL OF HEALTH CARE DELIVERY ADDRESSED

Group Clinical Practices

**TARGET POPULATION AGE**

Age greater than or equal to 18 years

**TARGET POPULATION GENDER**

Either male or female

**STRATIFICATION BY VULNERABLE POPULATIONS**

Unspecified

**Characteristics of the Primary Clinical Component**

**INCIDENCE/PREVALENCE**

See the "Rationale" field.

**ASSOCIATION WITH VULNERABLE POPULATIONS**

Unspecified

**BURDEN OF ILLNESS**

Unspecified

**UTILIZATION**

Unspecified

**COSTS**

Unspecified

**Institute of Medicine National Healthcare Quality Report Categories**

**IOM CARE NEED**

**IOM DOMAIN**

Effectiveness

## CASE FINDING

Users of care only

## DESCRIPTION OF CASE FINDING

Patients who are on the chronic kidney disease (CKD) register of a practice\*

**\*Note:** The Quality and Outcomes Framework (QOF) includes the concept of exception reporting. This has been introduced to allow practices to pursue the quality improvement agenda and not be penalised, where, for example, patients do not attend for review, or where a medication cannot be prescribed due to a contraindication or side-effect.

The following criteria have been agreed for exception reporting:

- A. patients who have been recorded as refusing to attend review who have been invited on at least three occasions during the preceding twelve months
- B. patients for whom it is not appropriate to review the chronic disease parameters due to particular circumstances, e.g., terminal illness, extreme frailty
- C. patients newly diagnosed within the practice or who have recently registered with the practice, who should have measurements made within three months and delivery of clinical standards within nine months, e.g., blood pressure or cholesterol measurements within target levels
- D. patients who are on maximum tolerated doses of medication whose levels remain suboptimal
- E. patients for whom prescribing a medication is not clinically appropriate, e.g., those who have an allergy, another contraindication or have experienced an adverse reaction
- F. where a patient has not tolerated medication
- G. where a patient does not agree to investigation or treatment (informed dissent), and this has been recorded in their medical records
- H. where the patient has a supervening condition which makes treatment of their condition inappropriate, e.g., cholesterol reduction where the patient has liver disease
- I. where an investigative service or secondary care service is unavailable

Refer to the original measure documentation for further details.

## DENOMINATOR SAMPLING FRAME

Patients associated with provider

## DENOMINATOR INCLUSIONS/EXCLUSIONS

### Inclusions

Patients who are on the chronic kidney disease (CKD) register\* of a practice

**\*Note:** The register includes patients aged 18 years and over with CKD (US National Kidney Foundation: Stage 3 to 5 CKD).

### Exclusions

See "Description of Case Finding" field for exception reporting.

## RELATIONSHIP OF DENOMINATOR TO NUMERATOR

All cases in the denominator are equally eligible to appear in the numerator

**DENOMINATOR (INDEX) EVENT**

Clinical Condition

**DENOMINATOR TIME WINDOW**

Time window is a single point in time

**NUMERATOR INCLUSIONS/EXCLUSIONS****Inclusions**

Number of patients from the denominator in whom the last blood pressure reading, measured in the previous 15 months, is 140/85 or less

**Exclusions**

Unspecified

**MEASURE RESULTS UNDER CONTROL OF HEALTH CARE PROFESSIONALS, ORGANIZATIONS AND/OR POLICYMAKERS**

The measure results are somewhat or substantially under the control of the health care professionals, organizations and/or policymakers to whom the measure applies.

**NUMERATOR TIME WINDOW**

Fixed time period

**DATA SOURCE**

Medical record  
Registry data

**LEVEL OF DETERMINATION OF QUALITY**

Not Individual Case

**OUTCOME TYPE**

Clinical Outcome

**PRE-EXISTING INSTRUMENT USED**

Unspecified

**Computation of the Measure****SCORING**

Rate

## **INTERPRETATION OF SCORE**

Better quality is associated with a higher score

## **ALLOWANCE FOR PATIENT FACTORS**

Unspecified

## **STANDARD OF COMPARISON**

External comparison at a point in time

Internal time comparison

Prescriptive standard

## **PRESCRIPTIVE STANDARD**

Payment stages: 40-70%

## **EVIDENCE FOR PRESCRIPTIVE STANDARD**

## **Evaluation of Measure Properties**

### **EXTENT OF MEASURE TESTING**

Unspecified

## **Identifying Information**

### **ORIGINAL TITLE**

CKD 3. The percentage of patients on the CKD register in whom the last blood pressure reading, measured in the previous 15 months, is 140/85 or less.

### **MEASURE COLLECTION**

[Quality and Outcomes Framework Indicators](#)

### **MEASURE SET NAME**

[Chronic Kidney Disease](#)

### **DEVELOPER**

British Medical Association  
National Health Service (NHS) Confederation

### **FUNDING SOURCE(S)**

The expert panel who developed the indicators were funded by the English Department of Health.

### **COMPOSITION OF THE GROUP THAT DEVELOPED THE MEASURE**

The main indicator development group is based in the National Primary Care Research and Development Centre in the University of Manchester. They are: Professor Helen Lester, NPCRDC, MB, BCH, MD; Dr. Stephen Campbell, NPCRDC, PhD; Dr. Umesh Chauhan, NPCRDC, MB, BS, PhD.

Others involved in the development of individual indicators are: Professor Richard Hobbs, Dr. Richard McManus, Professor Jonathan Mant, Dr. Graham Martin, Professor Richard Baker, Dr. Keri Thomas, Professor Tony Kendrick, Professor Brendan Delaney, Professor Simon De Lusignan, Dr. Jonathan Graffy, Dr. Henry Smithson, Professor Sue Wilson, Professor Claire Goodman, Dr. Terry O'Neill, Dr. Philippa Matthews, Dr. Simon Griffin, Professor Eileen Kaner.

### **FINANCIAL DISCLOSURES/OTHER POTENTIAL CONFLICTS OF INTEREST**

None for the main indicator development group.

### **ENDORSER**

National Health Service (NHS)

### **ADAPTATION**

Measure was not adapted from another source.

### **RELEASE DATE**

2006 Feb

### **REVISION DATE**

2009 Mar

### **MEASURE STATUS**

This is the current release of the measure.

This measure updates a previous version: British Medical Association (BMA), and NHS Employers. Quality and outcomes framework guidance for GMS contract 2008/09. London (UK): British Medical Association, National Health Service Confederation; 2008 Apr. 148 p.

## **SOURCE(S)**
